

THE STUDENT INSIGHT

They don't want to learn AI. *They want one AI project on their resume.*

WHO

Final-year B.Tech / BE students (2027 batch), tier-2 and tier-3 colleges, CSE / IT / ECE first. It's October, so placement season is on.

WHY THEY'D CARE

Every JD mentions AI. Their resume has a mini-project and nothing they built with AI. A 3-month course doesn't fit a placement season.

WHAT MAKES THEM REGISTER

A concrete output (a live link, a GitHub repo, one resume line), 60 minutes on a Sunday, and a friend who sent the link.

THE CORE PROBLEM

500 registrations in 7 days on ₹2,000 can't be *bought*. At student ad prices that buys ~80. The other 420 have to come from places students already are, and from each other.

Not a landing page. *A loop* that turns every registrant into a channel.

MEASURE	LEARN	SCALE
Every step fires an event: visit, form start, register, share, invite visit.	A/B test on the message, read on Day 5 with a significance test.	Winner to 100%, copy rewritten everywhere, remaining ₹1,000 behind it.

300

+

120

+

80

500

College communities

WhatsApp and Telegram class groups, posted by 15 student ambassadors.

₹0

Referral loop

Personal codes. 3 friends unlock the Starter Kit.

₹0

Paid experiment

Instagram ads: ₹1,000 to test two messages,
₹1,000 to scale the winner.

₹2,000

Registrations

Model: 505. Organic is upside, not plan.

20 colleges $\times$ 3 groups $\times$ 250 = 15,000 reached $\rightarrow$ 13% open $\rightarrow$ 1,950 visits $\rightarrow$ 15.5% = 302

$$₹2,000 \div ₹2.50 \text{ CPC} = 800 \text{ clicks} \rightarrow 10\% = 80 \text{ (CPR ₹25, the weakest assumption)}$$

382 direct $\times$ 40% share $\times$ 0.8 friends = 122 ($k = 0.32$, first-order only)

₹2,000 BUDGET

₹1,000 · A/B test · D3-5

₹1,000 · scale winner · D6-7

₹0 for ambassadors, rewards and leaderboard. Paid in status, not cash.

If assumptions break: paid CPR at ₹50 halves paid to 40. The fix is 3 more colleges (+45), not more money.

D7

Final push

Target / assumption. Not results. Each number is a slider in the Growth Model screen.

The Growth Engine: 9 *working screens*, one system.

Register → get a code → share → a friend registers through the link → the referrer’s count, reward progress and rank update. Every step is tracked. Demo controls simulate friends for the walkthrough.

Landing

Headline = live A/B variant. Invite banner when referred.

Referral dashboard

Code, one-tap WhatsApp, progress to reward, activity.

Growth console

Day scrubber, pace vs 500, channels vs target, funnel.

Experiment

Lift, p-value and CIs computed live. Decision logged.

HYPOTHESIS

“Career-oriented messaging will get more registrations than generic learning messaging.”

A · LEARNING

Learn AI in 60 minutes.

11.1%

79 of 712 visitors

B · CAREER · WINNER

Build an AI project for your resume.

16.6%

117 of 706 visitors

+49% relative lift · p = 0.003 · 95% CI +1.9 to +9.1 pts · guardrail: B shares more (44% vs 33%)

LEARNED

Outcome beats topic. Final-years respond to what the hour does for them, not what it teaches.

NOT YET KNOWN

Whether B changes who shows up. Registration isn’t attendance, so measure show-up per variant.

WHAT CHANGED

- Day 5: B to 100% of landing traffic
- Ambassador copy rewritten in career framing
- ₹1,000 behind B ads: CPR ₹25 → ~₹20

FIRST IDEA → FINAL

A landing page with a form. It converts, but it doesn’t grow. The final version is a referral loop with its own measurement, because ₹2,000 can’t buy 500 students and their friends can bring them.

WITH ANOTHER 24 HOURS

- Real backend + a WhatsApp bot (n8n) that sends codes and reminders
- Track attendance, not just registrations, per variant
- Run Exp 02: the three projects above the fold
